

Database Isolation Levels

In some modes, partial transaction state can leak into other threads.

```
DATABASES = {  
    'OPTIONS': {  
        'isolation_level':psycopg2.extensions.ISOLATION_LEVEL_SERIALIZABLE,
```

Highly complex topic, much more info can be found elsewhere...

It's possible to use a separate database with a higher isolation level for critical data

```
with transaction.atomic(using='default'):  
    with transaction.atomic(using='banking'):  
        MyModel_one(...).save(using='default')  
        MyModel_two(...).save(using='banking')
```

Django supports transactions across multiple databases.
